Primary posterior mediastinal hydatid cyst mimicking malignant mediastinal neurogenic tumor

Aram Baram, Fahmi H Kakamad, Ali A Alwan

ABSTRACT

Introduction: Hydatid disease is caused by Echinococcus granulosus parasite. It is an endemic disease; particularly in many Mediterranean countries. Bone involvement is reported in 1–2% of the cases and about 50% of those are seen in the spine. Herein we report a case of primary spinal extradural hydatid cyst that caused paraplegia due to compression of the dorsal spinal cord and was diagnosed initially as case of lumbar prolapsed intervertebral disc.

Case Report: A 40-year-old female referred to us suffering from painful spastic weakness of lower limbs, her condition started six months earlier to admission and she became paraplegic for last four months with loss of bladder and bowel control. She had L4, L5 lumbar laminectomy four months earlier as she was diagnosed as lumbar prolapsed intervertebral disc. After a thorough diagnostic workup, it was provisionally found that she has a malignant posterior mediastinal mass, but surprisingly only intraoperatively we discovered that she had only a posterior mediastinal hydatid cyst, which had been treated accordingly.

Conclusion: Hydatid cyst may speculate all types of thoracic tumors so high index of suspension should be considered in treating thoracic tumors in an endemic area.

Keywords: Mediastinal hydatid cyst, Neurogenic tumor, Paraplegia

INTRODUCTION

Hydatid disease is caused by *Echinococcus granulosus* parasite. It is an endemic disease; particularly in many Mediterranean countries. The liver and the lungs are most frequently involved [1]. Bone involvement is reported in 1–2% of the cases and about 50% of those are seen in the spine [2]. The first hydatid disease in spine was reported in 1807 by Chaussier [3]. Its clinical characteristics, diagnosis and therapy are still not definitive [3]. Spinal hydatid disease manifests itself through symptoms and signs related to compression of the cysts on other structures it has no specific pathognomonic symptoms or signs. The disease presents with radiculopathy, myelopathy and/or localized pain and tenderness owing to destructive bone lesions, pathological fracture and consequent cord compression [4]. X-ray appearance and computed tomography (CT) scan findings of spinal echinococcosis are non-specific and sometime misleading. Magnetic resonance imaging (MRI) is very sensitive diagnostic tool for hydatid cyst of spine [3].
CASE REPORT

A 40-year-old female referred to us suffering from painful spastic weakness of lower limbs, her condition started six months earlier to admission and she became paraplegic for last four months with loss of bladder and bowel control. She had L4, L5 lumbar laminectomy four months earlier as she was diagnosed as lumbar prolapsed intervertebral disc. Physical examination revealed bilateral lower limb weakness; power grade was zero, sensory loss from the level of D10, absence of all lower limb reflexes, distal pulses were positive. Per-rectal examination showed decreased anal tone. Chest X-ray showed left hilar shadow (Figure 1), CT scan revealed posterior mediastinal dumbbell tumor extended to the spinal canal at the level of D5, with destruction of left transverse process, pedicle, and fifth rib (Figure 2), MRI scan showed posterior mediastinal cystic lesion (Figure 3). Through mini-thoracotomy incision, exploration of the pleural cavity was done, cystic lesion was found in the left para-vertebral gutter with features of hydatid cyst, after isolation by Povidone-iodine soaked packs aspiration of the cyst was done which revealed caseating material and large number of small daughter cysts. Intraoperative orthopedic surgeon performed decompression of the canal anteriorly with partial anterolateral corpectomy. Histopathological examination of the specimen confirmed hydatidosis. She was treated by 800 mg Albendazole daily and program of physiotherapy. Full power movements appeared in four months post-operatively and her last MRI showed normal dorsal spinal cord with partial distortion of the body of D8-9 (Figure 4).

Figure 1: Ill-defined left hilar shadow.

Figure 2: Posterior mediastinal mass with features of malignant neurogenic tumor.

Figure 3: Posterior mediastinal dumbbell tumor extended to spinal canal at the level of D5-8, destruction of left transverse process, pedicle, and posterior part of fifth rib.

Figure 4: Normal dorsal cord with partial distortion of the body of D10.

DISCUSSION

Vertebral hydatidosis is a silent, slowly progressive disease. Pain is an important presenting symptom. Neurological disorders occur after a latent period of
several years [5, 6]. The diagnosis is considered if the patient lives in a geographic region where the infestation is known to occur [7]. Our case did not show any sign of chest involvement clinically and posterior mediastinal mass was an accidental finding on chest radiography during diagnostic workup for her paraplegia.

In bone tissue the larva behaves differently from soft tissue. It grows in direction of least resistance, infiltrating and damaging the bone like a tumor by exogenous vesiculation, then enlarged by endogenous vesiculation resulting in formation of daughter cyst [8]. Braithwaite and Lees classified the spinal hydatid as follows [9]:

- Primary intra medullary hydatid cyst
- Intradural extra medullary hydatid cyst
- Extradural intra spinal hydatid cyst
- Hydatid disease of the vertebra
- Paravertebral hydatid disease

The first three groups of hydatidosis are rare, and only sporadic cases have been reported [9]. We can classify our case as type (III) who recovered from paraplegia and to our knowledge only a few cases have been reported to regain full power [4, 6, 8]. Spinal involvement is believed to occur through vertebral–portal venous anastomosis or might be caused by encroaching pulmonary lesions. Rarely the disease begins from the extradural region [9]. Most spinal hydatid cysts are thoracic (52%), lumbar (37%) and then the cervical and sacral levels [4]. The surgical treatment consists of removal of cyst contents without contamination followed by appropriate management of any remaining cavity. The surgical area might be irrigated with chemical agents in an attempt to kill scoleces [7]. Indications for chemotherapy include inoperable lesions unless it is not a harmful lesion, unwillingness of the patient to undergo surgery, and use as an adjunct to surgery. The combination of chemotherapy and surgical treatment has been found to be more efficient than surgical treatment alone [9]. Albendazole has been found to be better absorbed than Mebendazole and exhibits superior efficacy against helminthes [7].

**CONCLUSION**

Although extremely rare, intraspinal extradural thoracic hydatid cyst might be a reversible cause of paraplegia, sphincter dysfunction and sensory loss. Surgical decompression is the treatment of choice followed by postoperative chemotherapy and program of physiotherapy. Hydatid cyst may speculate all types of thoracic tumors so high index of suspicion should be considered in treating thoracic tumors in an endemic area.

ABOUT THE AUTHORS

- **Aram Baram** is Head of Department of Cardiovascular and Thoracic Surgery at Faculty of Medical Sciences of University of Sulaimani, School of Medicine. His research interests include General Thoracic Surgery and peripheral vascular surgery. He has published (10) research papers in academic journals.

- **Fahmi H. Kakamand** is senior resident of cardiovascular and thoracic surgery at Faculty of Medical sciences of University of Sulaimani, School of Medicine. His research interests include General Thoracic and Vascular surgery. He intends to pursue (PhD in general thoracic surgery) in future.

- **Ali A. Alwan Al-tameemi** is Faculty member at the faulty of Medical Sciences of the University of Sulaimani, School of Medicine, Kurdistan, Iraq. His research interests include Orthopedics and spine surgery. He has published ten research papers in academic journals.
Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
