ABSTRACT

Introduction: Peritoneal mesothelioma is one of the very rare tumors of the abdominal cavity and represents 10% of all mesothelioma cases. Case Report: A 54-year-old male presented with weight loss and abdominal swelling. Computed tomography scans revealed calcified plaques in the pleura and extensive thickening of the omentum. A laparoscopic biopsy of the omentum revealed malignant epithelial mesothelioma. Conclusion: Although extremely rare, primary omental mesothelioma must be present in the differential diagnosis of omental mass in subjects with a history of exposure to asbestos.

Keywords: Peritoneal mesothelioma, Asbestosis, Omental mass

INTRODUCTION

Peritoneal mesothelioma is one of the very rare tumors of the abdominal cavity and represents 10% of all mesothelioma cases. It has been associated with chronic exposure to asbestos [1]. Omental mesothelioma is an extremely rare condition reported in only a few cases in the medical literature and presents both diagnostic and therapeutic challenges (Table 1) [2–5]. In this report, we present the clinical and radiological findings of a patient who had malignant mesothelioma originating from the omentum.

CASE REPORT

A 54-year-old male patient with no previous complaints presented to our hospital with a 7–8 kg weight loss within a month. The patient described the onset of extensive bone pain in whole body and abdominal swelling within the last month. The patient was cachectic and ascites and tenderness on the right lower quadrant was detected on physical examination. Computed tomography (CT) scans revealed calcified plaques in the pleura on the thoracic sections included in the investigative field (Figure 1). Extensive thickening of the omentum was observed with the thickest part reaching 4 cm, and thickening was more marked on the right side (Figure 2). The omental thickening extended to the anterior of the sigmoid colon (Figure 3). Furthermore, free fluid was observed in the perihepatic and pelvic regions. The presence of pleural calcified plaques on CT in an endemic asbestos region was considered to result from malignant mesothelioma, as no another primary malignancy was diagnosed. Malignant epithelial mesothelioma was found on laparoscopic biopsies. Medical supportive therapy involving diuretics (Lasix), analgesics, and anti-emetic was applied. The patient was not operated. Intermittent paracentesis were performed in case of need. The patient died 2 years after the diagnosis at his home and the family did not consent to an autopsy (Table 1).
**DISCUSSION**

Mesothelioma originates from the mesothelial cells lining the surface of the serous body cavities. Typically, tumors originate from the pleura and, to a lesser extent, from the peritoneum and, rarely, from the pericardium and tunica vaginalis testis [6]. Malignant peritoneal mesothelioma is characterized by neoplastic changes in the cells lining the peritoneal cavity surface and is very rare compared to pleural mesothelioma, representing approximately 10% of all mesothelioma cases [1]. Peritoneal involvement usually manifests as abdominal distention, anorexia, weight loss, and symptomatic malignant ascites. However, ascites was not reported in a previous case with omental mesothelioma [4]. Ascites was present in three out of four cases with primary omental mesothelioma. Cytological analysis of the fluid may help; however, diagnosis is usually established by laparotomy or laparoscopy. At the time of diagnosis, the mean age is 60 years, and the female male ratio is 1:3 [7]. Most of the patients have a history of asbestos exposure [1, 4]. However, this correlation is weaker in females [1]. Epidemiological trials have demonstrated an association between the occurrence of mesothelioma and environmental factors and carcinogens. The association between mesothelioma and asbestos was first demonstrated in 1960 by Wagner et al. In most of the cases presented in literature, there is a history of apparent asbestos exposure and of living close to regions where asbestos is intensively used [4, 8]. Asbestos exposure was present in our patient and a previous case [4] but not in another case [3]. We also detected pleural thickening in our case, which may be a radiological clue to the diagnosis of mesothelioma in patients with a concomitant omental mass or thickening.

Diffuse peritoneal mesothelioma is often characterized by many small (1–5 mm) bright, whitish nodules on the peritoneal surface at surgery. Larger nodules (2–5 cm) and infiltrative masses are commonly observed. At advanced stages, tumors mostly infiltrate the omentum and pleural cavity via the trans diaphragmatic route and exhibit distant metastasis [6, 7]. To the best of our knowledge, only three cases of malignant mesothelioma originating from the omentum have been reported [2–4]. Although the omentum primarily consists of fatty tissue, tumors of smooth muscle origin occur more commonly than fatty-origin tumors. Tumors originating from
Mesothelial cells are relatively rare. Most patients may present with complaints of abdominal discomfort, nausea, early satiety, weight loss, and a palpable abdominal mass, or patients may be asymptomatic [8]. In our case, the disease occurred with omental involvement, and weight loss was the most marked complaint.

The histology of malignant peritoneal mesothelioma is generally the same as the pleural type, and is classified into epithelial, sarcomatoid, and biphasic subtypes. In various series, the distribution of the types has been published. The most common histopathologic type affecting the pleura and peritoneum is the epithelial type, as it was the case in our patient [1].

The prognosis of mesothelioma is poor. After the diagnosis, the mean survival is 9–18 months for peritoneal tumors and 4–12 months for pleural tumors in cases of untreated patients [7]. Systemic chemotherapy and radiotherapy have little effect on the course of the disease, and complete surgical resection is not that beneficial [1]. However, prolonged survival in selected patients after intensive multimodality treatment has been reported [5]. These authors used surgical debulking, intraperitoneal chemotherapy, and immunotherapy followed by whole abdominal radiotherapy [5]. Sugarbaker et al. documented marked survival benefits of a multimodality approach that combined cytoreductive surgery with perioperative intraperitoneal chemotherapy [9]. The surgery utilizes a new peritonectomy surgical technique, which strips away the lining of the body cavity using ball-tip electrosurgery. This surgery removes the primary cancer and any dissemination within the cavity, and chemotherapy is used to eradicate microscopic disease. Hyperthermic intraperitoneal chemotherapy is showing some promise for the treatment of peritoneal mesothelioma; the combination of cisplatin plus doxorubicin at a temperature of 42°C was the preferred regimen by experts in hyperthermic intraperitoneal chemotherapy [10]. These new medical and surgical approaches have made previously lethal disease curable in selected patients.

CONCLUSION

Although, the association between pleural mesothelioma and chronic asbestos exposure is well known, primary peritoneal mesothelioma is a rare complication of asbestosis. Typically, it may manifest with ascites and peritoneal nodule-masses or it may be observed as an omental mass, as was the case in our patient. Therefore, primary peritoneal mesothelioma, although very rare, must be present in the differential diagnosis of subjects with an omental mass and a history of asbestos exposure.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
