Spontaneous common iliac artery thrombosis: An unusual cause of abdominal pain

Ralph Bou Chebl, Shafeek Kiblawi, Michael Nauss

ABSTRACT

Introduction: Acute arterial thrombosis is a rare and life-threatening condition which requires urgent recognition and prompt treatment to prevent limb loss or death. It usually arises from an embolic event, but it has also been reported as an incidental finding in patients with active malignancies, or connective tissue disorders. We report an unusual presentation of idiopathic common iliac thrombosis and review the literature on this subject.

Case Report: Herein, we describe a case of a young healthy man who presented to our emergency department on two separate occasions with abdominal pain and was found to have left common iliac artery thrombosis.

Conclusion: Iliac artery occlusion is a very rare condition that carries very serious complications. Clinicians should have a high level of suspicion and should initiate therapy as soon as the diagnosis is confirmed to avoid any catastrophic sequelae.

INTRODUCTION

Iliac artery thrombosis is a rare and limb-threatening condition which requires urgent recognition and treatment to prevent amputation or death. Unrecognized, it can lead to limb ischemia, tissue necrosis and sepsis resulting in death. It usually arises from an embolic event. Less commonly, it has been reported as an incidental finding in patients with active malignancies, connective tissue disorders and in some post-surgical cases. We describe a case of a young healthy male who presented to our emergency department on two separate occasions with abdominal pain and was found to have left common iliac artery thrombosis.

CASE REPORT

A 29-year-old male presented to the emergency department with a chief complaint of abdominal pain. The pain had started ten hours ago and was progressing. It was not associated with any nausea or vomiting. He denied any bloody stools and reported that his last bowel movement was a few hours prior to presentation. Surgical history included an exploratory laparotomy for a gunshot wound to the abdomen in 2000. The patient was afebrile and his vitals were normal except for mild tachycardia. He had some mild peri-umbilical tenderness without any guarding or rebound tenderness, and his rectal examination revealed guaiac negative stool in the rectal vault. The patient was seen in our emergency department 24-hours prior to this visit for multiple vomiting episodes after he had consumed alcohol. His physical examination was normal and laboratory workup showed normal levels of liver enzymes, lipase and electrolytes and mild leukocytosis of 11,200 leukocytes/mm³. He was given two liters of intravenous fluids and 4 mg of ondansetron intravenously, and was discharged home after his symptoms improved and he tolerated oral intake. On
his second presentation, due to his worsening symptoms and the physical examination findings, a decision was made to obtain a computed tomography (CT) scan of his abdomen. His CT scan showed a focal thrombus within the left common iliac artery causing 50% luminal narrowing (Figures 1 and 2). The patient had intact palpable pulses in his bilateral lower extremities. Vascular surgery was consulted and he was admitted to the general practice unit where he underwent a Trans Thoracic Echocardiography and a CT scan of chest with contrast to rule out any cardiac and aortic embolic sources. He also had a complete hypercoagulable workup which included a factor V Leiden, protein C/S, anti-thrombin III, and a prothrombin mutation test, all of which were normal. He also had normal Ankle Brachial Indices (ABI) and toe pressures. The patient was started on heparin and was discharged home, pain free on coumadin 5 mg daily. He returned for follow-up in three months and had a repeat CT scan that showed complete resolution of his thrombus.

**DISCUSSION**

Common iliac thrombosis is a very rare but lethal condition. Unrecognized, it leads to acute limb ischemia, a devastating condition defined as a sudden decrease in limb perfusion that threatens the viability of the limb and causes extensive tissue necrosis [1, 2]. The incidence of this condition is approximately 1.5 cases per 10,000 persons per year [3]. It most likely arises from an embolization event in patients with valvular diseases, atrial arrhythmias or due to ventricular thrombi arising after a myocardial infarction whereas thrombotic obstructions are generally associated with a progression of an atherosclerotic plaque [4]. It has been described as an incidental finding in patients with active malignancies, connective tissue disorders and in some postoperative cases [5, 6].

Physical examination findings are characterized by a constellation of symptoms referred to as the six ‘Ps’ including a painful, pulseless extremity distal to the occlusion, a perishingly cold and pale extremity. The vascular compromise is often accompanied by some neurologic manifestations, notably some paresthesias and paralysis [7].

Patients presenting with symptoms suggestive of acute limb occlusion are evaluated with an imaging modality to locate the obstruction. Digital subtraction angiography (DSA) is regarded as the gold standard for limb ischemia imaging [2]. However, due to its lack of invasiveness, CT angiography has recently come into wider use [4]. It has been shown to be a reliable diagnostic modality with sensitivities ranging between 89–98% [8].

Acute limb ischemia is a very morbid condition, with rates of amputations ranging between 10–15%, and a mortality rate of 15–20% within one year of the presentation. Death is usually from the conditions that predisposed them to acute limb ischemia [2]. The treatment of an acute complete occlusion includes catheter-based thrombolytic therapy, mechanical thromboembolectomy or pharmacologic thrombolysis with agents such as tissue plasminogen activator (TPA) [9]. Patients presenting with an incomplete occlusion are usually with systemic anticoagulation and a medical workup investigating the cause of the thrombosis [2].

**CONCLUSION**

Common iliac thrombosis is a devastating and highly morbid condition that requires a high index of suspicion. It usually presents with symptoms of decreased perfusion to the lower extremity. There is no case in literature of unprovoked common iliac artery thrombosis presenting as abdominal pain. This case demonstrates that a vascular occlusive event should on the differential and workup of patients presenting to the emergency department with abdominal pain.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
