18Fluorine fluorodeoxyglucose positron emission tomography diagnosis of an aortic thoracic prosthesis infection by slow-growing bacteria

Geraldine Celine Bera, Patrick Farahmand, Françoise Cavailloles, Charlotte Lepoutre-lussey

ABSTRACT

Abstract is not required for Clinical Images
**CASE REPORT**

A 66-years-old male with a history of aortic root aneurysm and bicuspid aortic valve underwent aortic root replacement with a Bentall procedure in 2009. Four years later, he presented to the emergency department with a fever and general malaise. Serial blood cultures were negative and a transthoracic echocardiogram showed no evidence of vegetations or an aortic root abscess. Although there was no evidence to support a diagnosis of infective endocarditis (IE) empirical antibiotic therapy, comprising vancomycin, gentamicin and rifampicin, was commenced. Two weeks later, a $^{18}\text{F}$-fluorodeoxyglucose positron emission tomography ($^{18}\text{F}$-FDG PET) was performed under a diet (low-carbohydrate and high-fat during 24-hours) designed to suppress myocardial activity. One hour after the injection of 295MBq of $^{18}\text{F}$-FDG radioisotope, 3 foci were highlighted around the aortic prosthesis (SUV$_{\text{max}}$ = 6, graft-to-mediastinum ratio SUV$_{\text{max}}$ = 3.2) (Figures 1–A, D, E) with additional uptake within mediastinal lymph adenopathies (SUV$_{\text{max}}$ = 2.6) (Figure 1B). There was no pathological uptake noticed around the adjacent aortic valve prosthesis (Figure 1C). This result was highly suggestive of an infection of the aortic tubular prosthesis and so surgery was undertaken to replace the aortic tubular prosthesis with a mechanical valve. During surgery, macroscopic examination confirmed the presence of pus inside the envelope surrounding the prosthesis. Cultures were taken during the surgery and analysis via polymerase chain reaction revealed the growth of *Kingella kingae*, the fifth member of the HACEK (*Haemophilus*, *Aggregation bacter*, *Cardiobacterium hominis*, *Eikenella corrodens* and *Kingella species*) bacteria group.

---

**Figure 1:** (A) Maximum intensity projection showing pathological mediastinal uptake and no uptake suggestive of septic emboli throughout the rest of the body, (B) Regional analysis of $^{18}\text{F}$-FDG uptakes point out on mediastinal lymphadenopathies, one on left latero-tracheal posterior area of upper mediastinum, (C, D) Typical uptake pattern around aortic thoracic prosthesis, and (E) Simultaneous computed tomography allow accurate localization.
DISCUSSION

The HACEK microorganisms, commensal residents of the oropharynx, are responsible for ~3% of cases of IE. They have an incidence of ~2–3 cases per 100,000 of population per annum and their mortality can reach up to 14%. These gram-negative bacilli are slow-growing, likely explaining the frequently negative blood cultures [1]. Diagnosis of cardiovascular prosthesis infections can be challenging with 30% having normal or inconclusive echocardiographic findings [2]. This often leads to a serious delay in instigating medical and, more importantly, surgical treatment. Saby et al. [2] have demonstrated that if used as a major criterion 18F-FDG PET increased the sensitivity of the modified Duke classification from 80–97%, without compromising its specificity. Thoracic aortic prosthetic graft infection is particularly rare and associated with very high morbidity and mortality [3]. Its diagnosis by conventional imaging is difficult due to non-specific nature of the findings and the sensitivity of magnetic resonance imaging remains unclear [2–4]. This report shows a high added value of 18F-FDG PET in the diagnosis of a sub-acute endocarditis even after fifteen days of a broad-spectrum antibiotic therapy. Focal 18F-FDG uptake around the cardiovascular prosthesis has a sensitivity of 93%, specificity of 91%, positive predictive value of 88% and negative predictive value of 96% for the diagnosis of prosthetic vascular graft infection [4]. A non-homogeneous uptake pattern around the cardiovascular prosthesis is described as a poor diagnostic marker [4]. While SUV\textsubscript{mean} and graft-to-mediastinum ratio represent the overall metabolic activity in the whole graft more accurately than SUV\textsubscript{max}, a SUV\textsubscript{max} > 8 in the surrounding graft area has been described as a potential cut-off value for distinguishing infected from non-infected grafts with sensitivity and specificity of 100% and 80%, respectively [3].

CONCLUSION

This report illustrates that 18F-FDG PET with a characteristic uptake pattern (focal uptake), a SUV\textsubscript{max} ≥ 6 and a graft-to-mediastinum ratio SUV\textsubscript{max} ≥ 3.2, allowed the detection of a cardiovascular prosthesis infection due to a slow-growing bacteria even following 2 weeks of antibiotic treatment.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
