Massive subcutaneous emphysema after domestic fall

Ida Carine Bø, Erik Waage Nielsen

ABSTRACT

Abstract is not required for Clinical Images

International Journal of Case Reports and Images (IJCRI)

International Journal of Case Reports and Images (IJCRI) is an international, peer reviewed, monthly, open access, online journal, publishing high-quality, articles in all areas of basic medical sciences and clinical specialties.

Aim of IJCRI is to encourage the publication of new information by providing a platform for reporting of unique, unusual and rare cases which enhance understanding of disease process, its diagnosis, management and clinico-pathologic correlations.

IJCRI publishes Review Articles, Case Series, Case Reports, Case in Images, Clinical Images and Letters to Editor.

Massive subcutaneous emphysema after domestic fall

Ida Carine Bø, Erik Waage Nielsen

CASE REPORT

A 72-year-old male was admitted to the hospital with shortness of breath and massive swelling of the face after a domestic fall the previous day. Upon admission the patient complained of nasal voice, difficulties with opening his eyes due to swelling and pain in the left hemithorax.

The patient recounted the previous day having stumbled on his right foot and hit the coffee table, with his left hemithorax taking most of the impact. In hospital, the patient was received by the trauma team. The examining surgeon noted nasal voice, and upon palpation midline trachea and massive subcutaneous emphysema of the face, neck, thorax and upper extremities (Figure 1). Auscultation of the lungs revealed bilateral breath sounds, described as weakened. Blood pressure was 150/95, saturation was 90% in room air and 94% with 3 L oxygen on a nasal cannula. Respiration rate 24 per min. There was a bruise on the left thorax, but no skin penetrating wound. Chest X-ray showed a small, left sided pneumothorax, but this was difficult to assess due to massive subcutaneous emphysema (Figure 2).

Arterial blood gas on admission showed a slight respiratory acidosis and hypoxemia with pH 7.33 (7.37–
7.45), pCO2 6.1 (4.7–6.0) kPa, pO2 8.4 (> 9.3) kPa and BE -2 (-2 - +3) mmol/L.

Computed tomography (CT) scan of the abdomen revealed subcutaneous emphysema involving erector spinae and deltoid muscles and bilateral upper extremities, in addition to thorax, neck and face. There was also pneumomediastinum and a relatively small pneumothorax bilaterally, but no lung collapse or dislocation of the trachea. The patient had a left sided flail chest with multiple fractures of costa 6–9. There was no visible injury to the trachea or bronchus (Figure 3 A–B). As the CT scan showed bilateral pneumothorax and the origin of the subcutaneous emphysema was uncertain the patient was immediately taken to the operating room and bilateral thorax drainage was inserted. The procedure was done in local anesthesia and slight sedation. Postoperatively, his respiration and circulation was normal.

The patient refused thoracic epidural as pain relief. Subsequently, he required large doses of opioids, in addition to NSAIDS and paracetamol. Over the following days the subcutaneous emphysema improved. Bilateral chest drainage was continued. However, the patient needed increasing doses of opioids, which resulted in inadequate respiration. Four days after admission arterial blood gas showed increasing respiratory acidosis and hypoxemia with pH 7.20 (7.37–7.45), pO2 6.1 (4.7–6.0), pO2 8.7 kPa (>9.3) and BE 4 mmol/L (-2+3). The trachea was intubated and the patient ventilated (4.7–6.0), pO2 8.7 kPa (>9.3) and BE 4 mmol/L (-2+3). The procedure was done in local anesthesia and slight sedation. Postoperatively, his respiration and circulation was normal.

The exact mechanism for development of air collections in the mediastinum remains uncertain. As the delay from injury to hospitalization contributed. The most common cause of pneumomediastinum is alveolar rupture [2]. Elevated alveolar pressure caused by e.g. airway obstruction, coughing or blunt trauma leads to rupture of the alveoli and air leakage. This could be the most likely explanation for the condition of our patient.

Pneumomediastinum, pneumothorax and subcutaneous emphysema are most commonly seen after severe trauma. In our patient, the mechanism of injury was modest, but caused extensive clinical findings. Probably, the delay from injury to hospitalization contributed. The exact mechanism for development of air collections within the thoracic cavity remains uncertain. As the patient responded well to treatment and was rapidly discharged from ICU further diagnostic examination was considered unnecessary.

CONCLUSION

Even modest blunt trauma such as domestic falls may occasionally lead to considerable subcutaneous emphysema. In our patient the subcutaneous emphysema was most likely from a pneumomediastinum. Air in the mediastinum is most often provided by alveolar rupture, and this could be the cause in our patient as well.

Keywords: Pneumomediastinum, Pneumothorax, Subcutaneous emphysema.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
