Disseminated tuberculosis: Challenges in diagnosis

Catarina Assis Cardoso, Teresa Filomena Garcia, Patricia Raimundo Cachado

ABSTRACT

Introduction: Disseminated tuberculosis is difficult to identify and probably underdiagnosed. Its prevalence in non-HIV patients is rising and a high index of suspicion must always be present, especially when other diseases are present, because there is usually considerable signs and symptoms overlap between them. Also, difficulties in obtaining adequate tissue specimens and body fluids is frequent not only because the patient may not be able to undergo some procedures but also adequate biological samples amount and material processing in high quality laboratories is needed to reach a definitive diagnosis.

Case Report: A case of a 67-year-old male with a past medical history of alcoholism and diabetes presented with cachexia, right pleural effusion, abdominal ascites and bilateral leg edema. Isolated thrombocytopenia was present. Heart failure was first diagnosed, but thrombocytopenia worsening led us to a high suspicion for tuberculosis. A series of factors such as heart failure treatment and restraints on adequate tissue biopsy specimens for histopathological and microbiological evidence delayed diagnosis. Bone marrow biopsy was the key for a conclusion. However, despite therapy, the patient’s condition did not improve and he passed away. Post-mortem examination revealed the extension of the disease.

Conclusion: Late diagnosis and treatment is one of the reasons why disseminated tuberculosis has such high rate mortality, so our aim is to raise awareness for its early identification with appropriate use of invasive procedures and also provide an example of some restraints that might preclude diagnosis, which physicians should pay attention to.

INtrODUctION

Tuberculosis is a highly prevalent disease in Portugal (incidence of 187 per 100,000 population) but disseminated form is rare (1%), especially in non-HIV patients. Although there have been some unusual case presentation reports, it is probably underdiagnosed in most of the patients and means a challenge for physicians because symptoms and signs may overlap other diseases,
sometimes with difficulties in establishing the diagnosis due to the fact that patients may not be able to undergo some invasive procedures.

CASE REPORT

A 67-year-old man born in Mozambique with Goa ancestry, living in Portugal for 30 years without any abroad trips, currently unemployed, with a past medical history of alcoholism, type 2 diabetes under control with metformin 850 mg twice daily and stage three chronic kidney disease, was admitted in the emergency department with a four-month history of anorexia, weight loss of 10 kg (previous weight: 60 kg), adynamia and dry cough. On physical examination the patient was emaciated. Lung auscultation revealed diminished sounds in the lower right hemithorax and the abdomen showed shifting dullness to percussion. There was discrete bilateral leg edema and doubtful hepatojugular reflux. Blood laboratory workup revealed chronic renal failure (creatinine 1.54 mg/dL, urea 87 mg/dL) a cyto-cholestatic pattern without hyperbilirubinemia (aspartate aminotransferase/alanine aminotransferase 70/89 U/L respectively, alkaline phosphatase 312 U/L), discrete International Normalized Ratio elevation to 1.5 and thrombocytopenia (78,000/mm\(^3\)) without additional cytopenias.

Thoracic X-ray showed a unilateral right effusion (Figure 1). We decided to hospitalize the patient for further investigation.

We considered the following differential diagnosis: neoplasia, tuberculosis or chronic hepatic disease. Infectious serologies, namely HIV and hepatitis were non-reactive. Tuberculin test was negative. Blood smear did not show significant abnormalities. Imaging exams such as abdominal ultrasound showed no signs of chronic hepatic disease but moderate ascites was noticed (Figure 2). Non-enhanced (due to renal failure) chest and abdominal computed tomography scan revealed mediastinal perihilar right adenopathies with a unilateral moderate right pleural effusion, cardiomegaly and moderate ascitic fluid (Figures 3 and 4).

Thoracentesis and closed pleural biopsy were not possible at the same time so they were scheduled in the following week. Meanwhile, transthoracic echocardiography revealed global hypokinesia with severe left systolic dysfunction, low ejection fraction of 17% with impaired right ventricle function. Brain natriuretic peptide was strongly elevated with 1,200 pg/mL. We considered a heart failure diagnosis, so treatment with diuretics, beta blockers, angiotensin II receptor blockers and small dose digoxin were started.

There was a gradual improvement of both pleural effusion and ascites, but on the other hand, a progressive decrease in thrombocytopenia to 55,000/mm\(^3\) and after a few additional days to 18,000/mm\(^3\) was noticed without additional explanation. Thoracic X-ray showed a marked decrease in right pleural effusion making closed pleural biopsy a high risk procedure, even with coagulopathy correction, so it was not performed. Meanwhile, a second abdominal ultrasound also showed very small ascites with significant diffuse bowel distension making the patient unfit for paracentesis.

Bone marrow biopsy was performed and few epithelioid non-caseous granulomas were identified with a negative acid-fast bacilli smear. Unexpectedly, myeloculture and blood culture showed the presence of a nosocomial bacteria Serratia marcescens, which contaminated the sample for mycobacterial growth. We decided to treat this infection with piperacillin-tazobactam according to antimicrobial susceptibility testing.

A second bone marrow biopsy attempt was made and this time significant stromal fibrosis due to Langhans giant cell granulomas, one with caseous necrosis, was identified.

Considering the patient’s history and bone marrow findings, disseminated tuberculosis was very likely, so we decided to add anti-tuberculosis drugs while the sample...
was being decontaminated for mycobacterial growth culture. The patient was started on a four drug therapy with isoniazid, rifampicin, pyrazinamide and ethambutol. Eventually there was a discrete improvement on platelets counts, but the patient died due to progressive malnutrition after one week of therapy.

Post-mortem examination revealed green ascites with identification of yellowish granulomas present in mesentery and subdiaphragmatic peritoneum. Mediastinal adenopathies were present bilaterally. Liver had a granular surface texture. Acid-fast bacilli were identified with Ziehl-Neelsen technique in granulomas, adenopathies and liver myeloculture was positive for *Mycobacterium tuberculosis*. Final diagnosis was disseminated tuberculosis with miliary bone marrow, abdominal and thoracic involvement.

**DISCUSSION**

Disseminated tuberculosis, especially miliary form, accounts for less than 2% of all cases and up to 20% of all extra-pulmonary cases in various clinical series. Classic presentation is seeding in the lung, as evidenced on chest radiography or computed tomography scan. But individual organ involvement, although unusual, is possible [1].

Also, it is more difficult to diagnose. Conventional acid fast bacilli smears have low sensitivity and require a long time for *Mycobacterium tuberculosis* to become evident during culture. As a result, diagnosis mostly depends on histological evidence.

Our case is different from other reported disseminated tuberculosis diagnosis [2–6] because we had to endure considerable difficulties on acquiring biological material for the final diagnosis. Heart failure first diagnosis and treatment decreased pleural and ascitic fluid, which together with coagulopathy made closed pleural biopsy a high risk procedure. Moreover, even if we tried paracentesis in a small amount of ascitic fluid, acid fast stained smear has a disappointingly low yield and not only the frequency of a positive culture is less than 20% [7, 8] but we also need to consider the usual four to six weeks delay of microbiological culture results.

Since the key to diagnosis was finding a few caseating granulomas in bone marrow histopathology. We call attention for bone marrow biopsy as a high profitable and less prone for complications invasive procedure whenever disseminated tuberculosis is suspected, especially when cytopenias are present [8].

Another problem was the identification of *Serratia marcescens* in myelocultures, which precluded mycobacteria growth. As far as literature reviews, no case of bone marrow culture with nosocomial bacteria isolation has been reported. Positive cultures from bone marrow have a low yield as described in literature [1, 9] but they remain the gold standard for tuberculosis diagnosis, especially in an era of multidrug resistance disease.

Mortality, in disseminated tuberculosis, is high in the range of 50 to almost 100%. Certain factors are thought to contribute to the variable outcome such as disease severity and underlying comorbidities, but delay in initiation of appropriate treatment is probably the most important. These two latter conditions were indeed present in our patient; he was extremely malnourished and treatment was started in a disease probably present for more than four months [10].

**CONCLUSION**

In conclusion, miliary tuberculosis still faces diagnostic difficulties. Our aim is to show and discuss diagnostic issues in acquiring appropriate tissue and body fluids since they must be obtained in the first place with
adequate amount and appropriate analysis in high quality laboratories whenever tuberculosis is to be considered.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
