MANAGEMENT OF A LARGE BLEEDINGPancreatic Pseudocyst by Embolization

Charaf Tilfine, Jawad Tadili, Amine Benkabbou, Salwa Bouklata, Nabil Moatassim Billah

ABSTRACT

Introduction: Hemorrhage from a pancreatic pseudocyst is a rare and often fatal complication of pancreatic trauma and pancreatitis. The pancreatic enzymes can erode into adjacent vessels, resulting in intracystic hemorrhage or bleeding into the peritoneal cavity, pancreatic duct, stomach, duodenum, colon, or retroperitoneum.

Case Report: We present a case of a large post-traumatic pancreatic pseudocyst in a 17-year-old adolescent, complicated by an intracystic hemorrhage that was successfully treated by selective arterial embolization.

Conclusion: A technical refinement both in diagnostic angiography and in transcatheter arterial embolization has strengthened the management of acute pancreatic pseudocyst hemorrhage. The embolization is an effective therapeutic alternative to surgery. A high index of suspicion should be maintained in any patient with a pseudocyst or a history of pancreatic trauma or chronic pancreatitis who presents with the abdominal pain, or falling hemoglobin level.

International Journal of Case Reports and Images (IJCRI)

International Journal of Case Reports and Images (IJCRI) is an international, peer reviewed, monthly, open access, online journal, publishing high-quality, articles in all areas of basic medical sciences and clinical specialties.

Aim of IJCRI is to encourage the publication of new information by providing a platform for reporting of unique, unusual and rare cases which enhance understanding of disease process, its diagnosis, management and clinico-pathologic correlations.

IJCRI publishes Review Articles, Case Series, Case Reports, Case in Images, Clinical Images and Letters to Editor.

INTRODUCTION

The pancreatic pseudocyst is a fluid collection held in intrapancreatic or extrapancreatic position. It contains pure pancreatic enzyme or mixed with necrosis or blood. It is devoid of epithelium and is limited by a fibrous and grainy wall [1]. This is a rare complication in children as opposed to adults in whom the pancreatic pseudocyst usually complicates ethyl chronic pancreatitis [1]. The most common causes of pancreatic pseudocyst in children are traumatic or medical acute pancreatitis [2]. A pancreatic pseudocyst frequency in the aftermath after a trauma ranges from 0–69% depending on the series [1]. Hemorrhage from a pancreatic pseudocyst is a rare and often fatal complication of pancreatic trauma and pancreatitis. We present a case of a large post-traumatic pancreatic pseudocyst in a 17-year-old adolescent complicated by an intracystic hemorrhage that was successfully treated by selective arterial embolization. The purpose of this observation is to show the importance...
of embolization as a first treatment of the bleeding pancreatic pseudocyst avoiding a surgical intervention.

CASE REPORT

A 17-year-old adolescent, with no particular history, admitted in emergency department with a severe abdominal pain and vomiting, after five days of direct abdominal trauma by fall from a height. Clinical examination revealed a thin, eupnoeic child weighing 45 kg, with a significant abdominal swelling, associated with diffuse pain centered especially in the epigastric area. Laboratory tests showed an increase in serum lipase (400 IU) with normal hemoglobin (13 g/dl).

Computed tomography scan performed in emergency (Figure 1) showed a large intraperitoneal and peripancreatic cystic mass which was homogeneous, with regular and thin wall measuring 20.4x11.4x15.2 cm. It was associated with a discrete hypodense lesion in the tail of the pancreas and peritoneal effusion of average abundance. The diagnosis of a voluminous pancreatic pseudocyst was taken.

The patient was hospitalized in the ICU for setting condition. After 15 days, he presented an acute abdominal pain with decreased blood pressure 90/40 mmHg. A CT control (Figure 2A–B) has objectified a significant intracystic bleeding in account of a hemorrhagic complication of pancreatic pseudocyst. It is in intimate contact with the splenic artery. It compresses the spleno-mesenteric trunk, delivers the celiac trunk and superior mesenteric artery back and stomach forward. Arteriography was performed showing a vascular blush at a branch of the dorsal pancreatic artery which was embolized successfully by a microspheres 500 µ (Figure 3A–D).

Figure 2: (A, B): Computed tomography scan showing hemorrhagic pancreatic pseudocyst and intimate contact with coelomesenteric vessels. (A) TC: celiac trunk, ART SP: splenic artery, ART HEP: hepatic artery. (B) AMS: superior mesenteric artery.

Figure 3: Arteriography and embolization. (A) Opacification of the common hepatic artery (CHA), the gastroduodenal artery (GDA) and hepatic artery proper (HAP), (B) Opacification of the splenic artery (SA) and dorsal pancreatic artery (DPA), (C) Selective catheterism of the dorsal pancreatic artery (DPA), and opacification of a vascular blush responsible for intracystic bleeding, and (D) Disappearance of vascular blush after embolization.

Figure 4: Computed tomography scan control after two months: Reduction of the volume of the pancreatic pseudocyst 5 (white arrow).
A CT control after two months showed a very reduction of the volume of the pancreatic pseudocyst measuring less than 4 cm of diameter (Figure 4).

DISCUSSION

Pancreatic trauma is relatively uncommon, but it has a high morbidity rate. Pseudocyst is one of the common major complications. Hemorrhage from a pancreatic pseudocyst is a rare and often fatal complication of pancreatic trauma and pancreatitis.

Many authors report a prevalence of acute hemorrhage associated with pancreatic pseudocysts estimated between 8% and 31% [3]. The consequence can be an intracystic hemorrhage or bleeding into the peritoneal cavity, pancreatic duct, retroperitoneum, or digestive tract.

Many arteries are involved in pseudoaneurysm formation. The most common are the splenic artery in 45–50%, the gastroduodenal artery in 15%, and the pancreaticoduodenal arteries in 15% [4]. They bleed in 78% of cases. The incidence of bleeding from the splenic artery is approximately half of the cases. Other articles have reported aneurysms of celiac, superior mesenteric, the hepatic and gastric arteries. Rarely, bleeding occurs from the renal artery, aorta, the splenic vein and visceral veins [5].

Bleeding can occur into the gastrointestinal tract, the duodenum being the most common site. Other sites include the stomach, jejunum, and colon. It can present as massive bleeding into the gastrointestinal tract with shock or as chronic gastrointestinal blood loss. Patients may present in some cases without gross gastrointestinal bleeding. If the pseudocyst does not communicate with the pancreatic duct, blood may be confined to the pseudocyst, manifested by rapid pseudocyst enlargement, pain, and a falling hemoglobin level. This is the case of our patient.

Every patient with ultrasound or CT findings suggesting an intracystic bleeding should benefit from a visceral angiography. It identifies the vascular anatomy and the site of bleeding. Many authors required that routine CT angiography should be performed to all patients with pancreatic pseudocysts to identify pseudoaneurysm and to anticipate hemorrhage [6].

In literature, surgery and embolization are the most treatments used. The tissues are often inflammed making the surgery difficult with risk of heightening hemorrhage. Mortality can reach 90% if bleeding was managed conservatively, and 29% in surgical intervention.

In several recent reports, embolization is advocated as the sole therapy for the treatment of pancreatitis associated pseudoaneurysms with high technical success rates (75–100%) and low morbidity (14–25%) and death rates (0–14%) [7].

Embolization was first described in 1972 by Rosch et al. who used autologous blood clot [8]. It may be used as a temporary procedure to stop or slow bleeding, or as the definitive form of treatment. It is recommended as the initial treatment for hemodynamically stable patients. Situations that justified an operation are: failed embolization, actively bleeding, unstable patients with hemodynamic failure, and complications such as infection and extrinsic compression [9].

Endovascular treatment has several advantages over open surgical repair, and carries a lower risk of major complications than open surgical repair. The radiologic management allows precise localization of the vascular blush responsible for intracystic bleeding and the nutrient artery, it is much less invasive than surgery.

The development of new micro-catheters, has improved the superselective embolization, and increase by consequent the success rate of this technique. In practice, many agents are used for embolization including muscle, cellulose, gelfoam, Ivalon, fat, tissue adhesives, steel coils, cotton, wool, and plastic and metallic spheres as the case of our patient [9]. The complications of embolization are scarce, it may be splenic infarction or intestinal necrosis.

CONCLUSION

A technical refinement both in diagnostic angiography and in transcatheter arterial embolization has strengthened this therapy for the emergency management of acute pancreatic pseudocyst hemorrhage. A high index of suspicion should be maintained in any patient with a pseudocyst or a history of pancreatic trauma or chronic pancreatitis who presents with the abdominal pain, or falling hemoglobin level.

Surgical treatment should be limited to patients for whom less invasive catheter-based embolization is not technically feasible, for patients who have undergone a failed embolization, or for recurrent actively bleeding after successful embolization.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open-access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.
