Port site hydatid cyst in operated case of laparoscopic cystostomy for liver hydatid cyst: A rare complication of laparoscopic hydatid cystostomy

Chirag K. Patel, Samir M. Shah, Smit M. Mehta, Vikram B. Gohil

ABSTRACT

Introduction: Hydatid disease in human is mainly caused by infection with the larval stage of the dog tapeworm *Echinococcus granulosus*. It is an important pathogenic, zoonotic and parasitic infection (acquired from animals) of humans, following ingestion of tapeworm eggs excreted in the feces of infected dogs. Location at unusual sites in the body had a great diagnostic challenge. The modern treatment of hydatid cyst of the liver varies from surgical intervention to percutaneous drainage or medical therapy. Surgery is still the treatment of choice for liver hydatid cyst and operation can be performed by the conventional or laparoscopic approach.

Case Report: We are reporting a case of occurrence of hydatid disease at port sites of abdominal wall in 42-year-old female patient operated previously for laparoscopic live hydatid cystostomy.

Conclusion: Occurrence of port site hydatid cyst is rare complication after laparoscopic hydatid cystostomy, but can occur due to lodgment of scolices at port site during laparoscopy.

Hydatid disease in human is mostly caused by infection with the larval stage of the dog tapeworm *Echinococcus granulosus*. It is an important pathogenic, zoonotic and parasitic infection of humans, following ingestion of tapeworm eggs excreted in the feces of infected dogs. Cystic hydatid disease usually affects the liver (50–70%) and less frequently the lung, the spleen, the kidney, the bones, and the brain [1]. Treatment of hydatid liver cyst has to be considered in symptomatic cysts and recommended in viable cysts because of the risk of severe complications [1]. The modern treatment of hydatid cyst of the liver varies from surgical intervention to percutaneous drainage. Surgery is still the treatment of choice and can be performed by the conventional or laparoscopic approach.
CASE REPORT

A case of 45-year-old female which was operated for laparoscopic cystostomy for single liver hydatid cyst (6×5 cm in right anterior lobe of liver, diagnosed by CECT abdomen). After four months of laparoscopic cystostomy, she was admitted in our hospital with complain of swelling and pain at the abdomen over previous laparoscopic port site scar. On per abdominal examination, there was a single 5×5 cm sized tender swelling at right hypochondrial port site scar with inflamed and reddish overlying skin. Ultrasonography (USG) scan of abdomen suggestive of 5×4×4 cm sized hypo echoic lesion with internal septation at the anterior abdominal wall at port site with extension to right sub diaphragmatic space with normal liver. Rest of biochemical and hematological investigation were normal. Initially, we suspected an abscess at port site, so we had planned for incision and drainage of material. But during operation, we came to know that the material resemble the endocyst and brood capsule of hydatid cyst. So we had removed all material and site washed with 0.5% cetrimide solution and flower tip malecot catheter inserted under USG guidance into the sub diaphragmatic extension. There was approximately 30 cc output from the malecot catheter for two days, and it was removed on fourth postoperative day. Wound at port site healed secondarily within two weeks. We had sent material for histopathological examination which was revealed hydatid cyst material (Figure 2).

DISCUSSION

Diagnosis of hydatid disease of liver can be made easily but hydatid cyst at unusual sites needs clinical correlation, serological tests, and imaging study (USG, CT scan, and MRI scan) before any intervention is planned. The diagnosis is often difficult when hydatid cyst occurs at unusual locations. As USG provide information that resembles the abscess, we recommend further imaging with MRI scan to delineate the lesion and adequate planning of management. Serologic tests usually allow hydatid cysts to be distinguished from nonparasitic cysts and abscesses [2].

Surgery remains the gold standard treatment for hydatid liver disease and can be performed by the conventional or laparoscopic approach. The aim of surgical intervention is to inactivate the parasite, to evacuate the cyst along with resection of the germinal layer, to prevent peritoneal spillage of scolices and to obliterate the residual cavity. However, surgery may be impractical in patients with multiple cysts localized in several organs and if surgical facilities are inadequate. The introduction of chemotherapy and of the PAIR hydatid cysts of the liver (puncture - aspiration-injection-respiration) offers an alternative treatment, especially in inoperable patients and for cases with a high surgical risk. Cysts with homogeneously calcified cyst walls need, probably, no surgery but only a ‘wait and observe’ approach.

Laparoscopic liver hydatid cystostomy is now considered as minimal invasive surgery without mach complication but following the laparoscopic liver cystostomy recurrence is the major problem [3].

Here we reported a case operated for liver hydatid cyst, which was later on presented as a port site hydatid cyst as clinically (clinical feature) resembling the abscess. There was no study reporting the port site occurrence of hydatid cyst. As we hypothesized, the occurrence of port site hydatid cyst most probably due to contamination of ports with hydatid material and lodgment of scolices at port site during laparoscopy. On reporting this case we also recommend that the wash of port site with scolicidal agent after laparoscopic cystostomy can helpful to prevent port site recurrence, but further research work were needed.

CONCLUSION

Occurrence of port site hydatid cyst is rare complication after laparoscopic hydatid cystostomy, but can occur due to lodgment of scolices at port site of laparoscopy.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
