Burkitt’s lymphoma presenting as jejunojejunal intussusception in a child: A case report

Karimy Hamad Mehanna, José Ederaldo Queiroz Telles, Danielle Priscila Mauro

ABSTRACT

Burkitt’s lymphoma represents 1–2% of all lymphoma and displays aggressive behavior, with B cells showing rapid growth. Its presentation as intestinal intussusception is unusual. We describe case of a seven-year-old boy with intussusception due to Burkitt’s lymphoma. An emergency laparotomy revealed jejunojejunal intussusception as the cause of obstruction. The patient underwent enterectomy with restoration of the bowel continuity. Pathologist diagnosed Burkitt’s lymphoma. He is receiving chemotherapy and is well one month postoperatively.

ABSTRACT

Burkitt’s lymphoma represents 1–2% of all lymphoma and displays aggressive behavior, with B cells showing rapid growth. Its presentation as intestinal intussusception is unusual. We describe case of a seven-year-old boy with intussusception due to Burkitt’s lymphoma. An emergency laparotomy revealed jejunojejunal intussusception as the cause of obstruction. The patient underwent enterectomy with restoration of the bowel continuity. Pathologist diagnosed Burkitt’s lymphoma. He is receiving chemotherapy and is well one month postoperatively.

Keywords: Burkitt’s lymphoma, Child, Intussusception, Non-Hodgkin lymphoma

INTRODUCTION

Intussusception of the bowel can be described as the telescoping of a proximal segment of the intestine within the lumen of the adjacent segment. First reported in 1674, it is one of the most common causes of an acute abdomen in infancy. Burkitt’s lymphoma is a subtype of non-Hodgkin lymphoma (NHL), showing malignant features and rapid growth. It was first described by Denis Burkitt in 1958. Commonly, presents as acute leukemia or malignant lesions in extra nodal sites. Intussusception due to Burkitt’s lymphoma is rare presenting, with nonspecific symptoms. We present a case of jejunojejunal intussusception secondary to Burkitt’s lymphoma in a child, and we would like to share the presentation, outcome, and our experience in the management of this child, with a review of literature.

CASE REPORT

A 7-year-old boy reported to the emergency with abdominal pain and vomiting for the last two days. A detailed history revealed an intermittent colicky abdominal pain for at least one year. No changes in bowel habits and no weight loss was reported.

On clinical examination, abdomen was mildly distended with palpable mass in the left flank and signs of peritoneal reaction in this affected site. Bowel sounds were reduced. All other aspects of the examination were normal. Laboratory investigations showed total leukocyte counts (TLC) of 12.55/mm³ with neutrophilia and raised inflammatory markers (CRP 3.56 mg/dl). Chest X-ray was normal; abdominal plain X-ray showed dilated loops of bowel containing gas, but the findings were
nonspecific for intestinal obstruction or ileus (Figure 1). Ultrasonography (USG) showed target sign located at mesogastrum and left flank. The diameter of the lesion was 4 cm and the length was 6 cm (Figure 2). Additionally, a small amount of ascites was noted.

A decision for an emergency laparotomy was taken. Intraoperative findings confirmed jejunojejunal intussusception (Figure 3). The involved parts of the bowel were resected and end-to-end anastomosis was performed. During inspection of the bowel, we noted a mass within the jejunum, working as lead point of the intussusception (Figure 4). Cut sections of the specimen showed jejunal tumor (Figure 5). The histopathological diagnosis was Burkitt’s lymphoma with clear surgical margins (Figure 6). On immunohistochemistry, CD-20 was positive (Figure 7).

Postoperatively the patient made an uneventful recovery and was referred to the oncology team for appropriate further management. He was subject to chest CT scan and bone-marrow biopsy. Both tests were normal. The disease was classified in stage II (extra nodal site, disease restricted to abdomen). He is receiving vincristine, adriamycin, cyclophosphamide and prednisolone based chemotherapy on Department of Oncology (chemotherapy protocol of the French Society of Pediatric Oncology) and is well one month postoperatively.

DISCUSSION

Non-Hodgkin Lymphoma (NHL) is the third most frequent cancer of childhood and represents 1–4% of all gastrointestinal malignancies [1]. The peak age for gastrointestinal NHL in children is 5–15 years with a male sex preponderance 1.8-2.5 times that of female [2]. Small and large intestines are frequent affected and ileum is most commonly involved, in which the greatest concentration of gut-associated lymphoid tissue is present. Non-Hodgkin Lymphoma (NHL) is usually subdivided into three histological subtypes: (a) 65% B-cell NHL including both Burkitt’s lymphoma and diffuse large B cell lymphoma – most commonly predict the abdomen as a primary site of presentation; (b) 20% lymphoblastic, and (c) 15% anaplastic large cell lymphoma. Burkitt’s NHL is the most common, representing 40–50% of all NHL cases in childhood [3].

In upto 18% patients with primary abdominal Burkitt’s lymphoma, intussusception is the first clinical sign. The incidence of NHL acting as lead point in intussusception is reported to be as high as 17%, and even higher (more than 50%) in children over 4–6 years of age [4]. Abdominal pain is present in 80% of cases, along with nausea, vomiting, changes in bowel habits and weight loss. Intestinal involvement by NHL was associated with an increased frequency of abdominal symptoms resulting in earlier laparotomies and earlier diagnosis [4].
Previous author’s experiences with the combination of NHL with intussusception have not been satisfactory. In Ein et al. study, only 3 of 11 children were term survivors [5]. This study of over than 1200 infants and children in Toronto over a 40-year period revealed 11 lymphomas manifested as a leading point for the intussusception. Most patients were older than 4.5 years, were chronically ill, sometimes for several months, and had weight loss and abdominal mass, all of which pointed to a malignant process [5]. Puri et al. also reported that the only one death out of the entire series of 292 children with intussusception was a child with lymphoma [6].

The ideal treatment of gastrointestinal lymphoma must be individualized based on the type of disease and its location and a multidisciplinary approach with surgery and chemotherapy increases the chances of event free survival. Surgery plays a pivotal role in the management. In fact, LaQuaglia et al. in his study has concluded that bowel resection performed during emergency laparotomies for symptomatic, localized bowel involvement in patients
with NHL was associated with better prognosis [7]. Some reports demonstrate higher survival rate (58–89%) in patients having extensive surgical resection versus patients having only partial or incomplete resection (40–45%) at 2–5 years [3]. Complete resection of the tumor was shown to have the added advantage of avoiding bowel perforation, gastrointestinal hemorrhage or the tumor lysis syndrome after the initiation of chemotherapy [4]. Chemotherapy represents a cornerstone in the treatment of these patients and offers an excellent chance for long term disease free survival. Burkitt’s lymphoma is very sensitive to chemotherapy. Therapy courses include the following drugs: cyclophosphamide, methotrexate, cytarabine, ifosfamide, etoposide, vincristine, vindesine, adriamycin, doxorubicin, dexamethasone. Rituximab is currently being studied in clinical trials, because it has shown good results in adult NHL. Although regimens are effective, they are toxic and up to 3% patients can die from treatment complications, with the acute tumor lysis syndrome being one of them. Burkitt’s lymphoma patients who present with intussusception have a low stage disease (stage II), have a complete resection of their tumor, require shorter-duration, and less intense chemotherapy than patients diagnosed in other ways. Extent of disease at presentation and the resectability has been found to be the most important prognostic factor [4].

CONCLUSION

Intussusception should be considered in the differential diagnosis of all children who present with an acute abdomen, regardless of age. In the older age group of children, we need to keep a high index of suspicion for malignant lymphoma of the bowel. The clinical presentation is non-specific with abdominal pain, nausea and vomiting in most of the cases. Surgery is the gold standard in both diagnosis and treatment, ensuring the excision of the entire tumor with free margins. A multidisciplinary team with an oncologist assures efficient therapeutic management.
Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
