The gastrocnemius muscle flap for coverage of soft tissue defect of the proximal third of lower leg

Ingo Schmidt

To the Editor,

Postoperative soft tissue defect with exposure of relevant structures such as bone with or without osteosynthesis plates of the proximal third of lower leg represents a challenging problem. A 57-year-old male presented with a highly comminuted open fracture of the proximal right tibia (Figure 1A). First, the fracture was stabilized by knee joint-bridging external fixation. After four debridements and negative-pressure vacuum assisted closure (VAC) therapies including incorporation of polymethyl methacrylate (PMMA) beads containing gentamycin (Figure 1B), the pre-tibial soft tissue defect could be covered with a medial gastrocnemius muscle flap and additional splitted skin grafts (Figure 1C). Then, the fracture was definitively treated with open reduction and internal fixation (ORIF). After eight weeks of injury, there was uncomplicated fracture and wound healing with complete restoration of knee joint function (Figure 1D–E), and 12 weeks after injury the patient could be mobilized with full weight-bearing on the affected leg.

The use of local flaps for coverage of soft tissue defects of the proximal third of lower leg and knee is an option for treatment in patients who are not willing or healthy enough to undergo free microvascular tissue transplantation, and do not require microsurgical expertise. The use of the gastrocnemius muscle flap is one method of choice for reconstruction [1]. There is only one vasculonervous pedicle for each of both muscle heads composed of a sural artery and one or two veins, and is classified as type I according to the classification of Mathes and Nahai [2]. It is possible to divide the muscle in two sections longitudinally according to the needs. However, the lateral head has to be rotated around the proximal fibula, therefore, it has a lower rotation angle than the medial head. There is an option to safely harvest a skin paddle overlying the muscle [3]. The gastrocnemius muscle flap is probably one of the safest flap, however, muscle flaps for reconstruction of legs are generally not free of any complications. Neale et al. [4] reported on major and minor complications in 32% of a total of 95 muscle flaps and they agreed that the causes were mainly technical errors, inadequate debridement, use of diseased and traumatized muscle, and unrealistic objectives.

a gastrocnemius muscle flap is not indicated, the use of random pattern skin transposition flaps is one salvage option [5].

**ABOUT THE AUTHOR**

**Ingo Schmidt** is a surgeon in the Department of Traumatology SRH Poliklinik, Waldklinikum Gera GmbH, Germany. From 1983 to 1989, he studied human medicine at the Friedrich-Schiller-University in Jena (Germany). From 1990 to 1999, Dr. Schmidt graduated his training for general surgery, traumatology, orthopaedics, and hand surgery at the University hospital in Jena. In 1994, he successfully defended his scientific work to gain the title as a medical doctor. He has published more than 20 scientific articles. His areas of interest include hip replacement, coverage of soft tissue defects, and hand surgery with special focus on total wrist replacement and arthroplasties of all other joints of the hand.
Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open-access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
