Hypopharyngeal non-penetrating steel shrapnel foreign body: A case report of unusual route of impaction

Ahmad Nasrat Al-juboori, Abdalla Mirghani Hamid

ABSTRACT

Introduction: Foreign body injury is one of the most commonly encountered otorhinolaryngologic emergencies. The diagnosis and management of foreign bodies have mainly been based on the type and location of the foreign body. The workplace is a significant contributor to fatal and non-fatal injuries worldwide and an insufficiently appreciated contributor to the total burden of health care costs. Steel workers sustain a higher occupational hazard of penetrating injuries anywhere in the body, including the head and neck. However, we found no reports in literature about non-penetrating shrapnel foreign body injuries, particularly in the upper aero-digestive tract.

Case Report: A steelworker presented to the emergency department in Al Wakra hospital with a history of non-penetrating steel foreign body impaction in the throat which had been visualized by GlideScope and removed successfully with the assistance of Macintosh laryngoscope without complications. The purpose of this presentation is to highlight the unusual route taken by a shrapnel non-penetrating foreign body, through the open mouth to the hypopharynx.

Conclusion: We concluded that this report could be regarded as the first case report of a non-penetrating steel foreign body with an unusual per oral route of impaction in the hypopharynx. It, also, highlighted its visualization and a comparison between two techniques of its extraction.
Hypopharyngeal non-penetrating steel shrapnel foreign body: A case report of unusual route of impaction

INTRODUCTION

Foreign body ingestion is one of the most commonly encountered otorhinolaryngologic disorders, often requiring urgent decision making and management. In particular, it has been reported that children younger than three years exhibit the greatest risk of foreign body swallowing [1, 2]. In adults, foreign body ingestion occurs commonly, the majority of them pass spontaneously but some of them will impact at the hypopharyngeal level [3]. The result may be severe due to possible ulceration or even perforation with consequent life-threatening complications [4, 5]. Many studies of foreign body injuries have focused on the case of young patients [2, 6].
However, it is also important to determine the frequency and characteristics of foreign body injuries in other age groups in addition to young children. Previous studies have demonstrated that some fatal cases occur in elderly patients due to foreign body asphyxia [7].

The diagnosis and management of foreign bodies have mainly been based on the type and location of the foreign body. Therefore, clinical information on the type and location of foreign bodies can expedite the management of these patients [7]. The workplace is a significant contributor to fatal and non-fatal injuries worldwide and an insufficiently appreciated contributor to the total burden of health care costs, like the occupational hazards of steel workers who manifest with penetrating injuries anywhere in the body [8]. However, there are no reported non-penetrating injuries of steel worker foreign body injuries particularly in the upper aerodigestive tract.

The aim of the presentation of this case report is to highlight the route of a non-penetrating steel foreign body in the hypopharynx in a steelworker, and probably this could be the first reported case of this unusual route of entry.

CASE REPORT

A 25-year-old steelworker presented to the emergency department in Al Wakra hospital with a history of foreign body impaction in the throat during work. When one of his colleagues was hammering steel nearby him, he felt something entering through his mouth, when it was open and getting inserted inside the throat. He was complaining of odynophagia, dysphagia with progressive change of voice. On examination, the patient was conscious, afebrile, not in respiratory distress and hemodynamically stable. Complete ear, nose and throat examination was normal, apart from a small wound at the tip of the tongue. Neck examination showed no evidence of external wounds or subcutaneous surgical emphysema but there was mild tenderness over the right side of the neck. Flexible nasolaryngoscopy done under local anesthesia showed impacted foreign body (metal) on the right side of the supraglottic area with edema of the surrounding area of the epiglottis, aryepiglottic fold, arytenoids and part of the vocal fold on the right side. Plain X-ray of the neck, anteroposterior and lateral views, showed evidence of a metallic radio-opaque foreign body at the level of the fourth cervical vertebra directed towards the right side (Figure 1).

The patient was prepared for examination under general anesthesia and the removal of the foreign body with the assistance of rigid scopes. Examination under general anesthesia in the supine position with full sedation and assistance of a GlideScope, revealed a clear video picture of the metallic foreign body in the right pyriform sinus (Figure 2A). Trial of removal through the GlideScope guidance failed, unfortunately, because of difficulties in directing the instrument towards the metallic foreign body. Then with the use of Macintosh laryngoscope the metallic foreign body was removed by forceps (Figure 3). Re-examination of the site of the foreign body was done again with the GlideScope and suction to the site of the foreign body to ensure there was no perforation (Figure 2B).

In the postoperative period, the patient was kept for continuous intravenous fluids for the next 24 hours, with frequent checking of the neck for possible emphysema, then fluid diet was started for the next few hours and then the patient was discharged in good condition on the second postoperative day after psychiatric assessment to make sure that he is of normal mentality.

DISCUSSION

Foreign body ingestion is more common in adults with mental developmental delay, psychiatric and neurological disorders or intoxication and in patients with dentures or dental bridges because of the decrease in tactile sensation during swallowing. The most commonly ingested foreign bodies are fish and chicken bones and there is an apparent predominance of certain types in specific groups of patients [9], e.g., coins and toys in children, razor blades and cutlery in prisoners [10]. Our case report highlights
the peculiar route taken by the shrapnel foreign body, through the open oral cavity to the hypopharynx, a route we think have not been reported before. Also, it appears that the foreign body has taken a curved projectile rather than a straight pathway. This is suggested by the fact that no injuries were found in the oral cavity or oropharynx, apart from a small laceration at the tip of the tongue. Medline search did not report this kind of foreign body route of entry, so we consider this is the first reported case with such description. GlideScopes represent a recent advancement over the Macintosh laryngoscope. It has increased endotracheal intubation success rate, and it is recommended mainly in the management of potential difficult airways in several patient populations [11]. The use of these devices to remove foreign bodies has been reported previously only in two adult patients affected by a non-impacted partial denture in the hypopharynx [12]. While desirable, it is not reported so far in the pediatric population. Je et al., in a cadaver study, compared Macintosh laryngoscope and the GlideScope for extracting hypopharyngeal foreign bodies. He stated that it is not possible to conclude that videoscopes are inferior to the Macintosh laryngoscope for foreign body extractions, and that the GlideScope might be necessary to aid the foreign body extraction in emergency situations [13]. In our case report, the GlideScope provided good indirect visualization and localization with magnification of the foreign body but it did not provide good access for removal. On the other hand, the Macintosh provided a direct visualization of the foreign body and easy removal and extraction.

CONCLUSION

From previous descriptions, we concluded that this report could be regarded as the first case report of a non-penetrating steel foreign body with an unusual per oral route of impaction in the hypopharynx. It, also, highlighted its visualization and a comparison between two techniques of its extraction.

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
